

User Stories Deep Dive

"As a user, I want the app to be faster and more secure so that I can enjoy using it without any issues."

"As a user, I want the app to be faster and more secure so that I can enjoy using it without any issues."

Problem: This story is very broad, covering both performance and security without specific details. It's not independent because improvements in speed and security might depend on multiple other changes across the app.

"As a customer, I want the best user interface so that I enjoy using the app."

"As a customer, I want the best user interface so that I enjoy using the app."

Problem: "The best user interface" is subjective and doesn't provide clear criteria for what needs to be done. It's not negotiable because it doesn't open room for discussion on specific improvements or features.

"As a developer, I want to refactor the backend code to follow the new coding standards."

"As a developer, I want to refactor the backend code to follow the new coding standards."

Problem: While important from a technical perspective, this story does not directly deliver value to end users in terms of new features or improvements they can experience.

"As a marketing team, we want to implement a feature so that it will make our app go viral."

"As a marketing team, we want to implement a feature so that it will make our app go viral."

Problem: This story is too vague and ambitious without clear steps or criteria for success, making it impossible to estimate how long it will take or how much work it will involve.

"As a restaurant owner, I want a complete overhaul of the app including redesigning the menu, updating the payment system, and adding a loyalty program so that the users can have a better experience"

"As a restaurant owner, I want a complete overhaul of the app including redesigning the menu, updating the payment system, and adding a loyalty program so that the users can have a better experience"

Problem: This story is too large, encompassing multiple major features and changes that should be broken down into smaller, more manageable stories.

"As a user, I want modern features so that the app to feel more modern."

"As a user, I want modern features so that the app to feel more modern."

Problem: Without specific criteria for what "modern" means, this story is not testable. There's no clear way to measure or test whether the app has achieved a "modern" feel.
